

The SST39LF200A/400A/800A and SST39VF200A/400A/800A devices are 128-Kbit x16 / 256-Kbit x16 / 512-Kbit x16 CMOS Multi-Purpose Flash (MPF) manufactured with Microchip proprietary, high-performance CMOS SuperFlash technology. The split-gate cell design and thick oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST39LF200A/400A/800A write (Program or Erase) with a 3.0V-3.6V power supply. The SST39VF200A/400A/800A write (Program or Erase) with a 2.7V-3.6V power supply. These devices conform to JEDEC standard pinouts for x16 memories.

Features

- **Organized as 128-Kbit x16 / 256-Kbit x16 / 512-Kbit x16**
- **Single Voltage Read and Write Operations**
 - 3.0V-3.6V for SST39LF200A/400A/800A
 - 2.7V-3.6V for SST39VF200A/400A/800A
- **Superior Reliability**
 - Endurance: 100,000 Cycles (typical)
 - Greater than 100 years Data Retention
- **Low Power Consumption (typical values at 14 MHz)**
 - Active Current: 9 mA (typical)
 - Standby Current: 3 μ A (typical)
- **Sector-Erase Capability**
 - Uniform 2 KWord sectors
- **Block-Erase Capability**
 - Uniform 32 KWord blocks
- **Fast Read Access Time**
 - 55 ns for SST39LF200A/400A/800A
 - 70 ns for SST39VF200A/400A/800A
- **Latched Address and Data**
- **Fast Erase and Word-Program**
 - Sector-Erase Time: 18 ms (typical)
 - Block-Erase Time: 18 ms (typical)
 - Chip-Erase Time: 70 ms (typical)
 - Word-Program Time: 14 μ s (typical)
 - Chip Rewrite Time:
 - 2 seconds (typical) for SST39LF/VF200A
 - 4 seconds (typical) for SST39LF/VF400A
 - 8 seconds (typical) for SST39LF/VF800A
- **Automatic Write Timing**
 - Internal V_{PP} Generation
- **End-of-Write Detection**
 - Toggle Bit
 - Data# Polling
- **CMOS I/O Compatibility**
- **JEDEC Standard**
 - Flash EEPROM Pinouts and command sets
- **Packages Available**
 - 48-lead TSOP (12 mm x 20 mm)
 - 48-ball TFBGA (6 mm x 8 mm)
 - 48-ball WFBGA (4 mm x 6 mm)
- **All non-Pb (lead-free) devices are RoHS compliant**

2-Mbit / 4-Mbit / 8-Mbit Multi-Purpose Flash

SST39LF200A / SST39LF400A / SST39LF800A

SST39VF200A / SST39VF400A / SST39VF800A

Data Sheet

Product Description

The SST39LF200A/400A/800A and SST39VF200A/400A/800A devices are 128-Kbit x16 / 256-Kbit x16 / 512-Kbit x16 CMOS Multi-Purpose Flash (MPF) manufactured with Microchip proprietary, high-performance CMOS SuperFlash technology. The split-gate cell design and thick oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST39LF200A/400A/800A write (Program or Erase) with a 3.0V-3.6V power supply. The SST39VF200A/400A/800A write (Program or Erase) with a 2.7V-3.6V power supply. These devices conform to JEDEC standard pinouts for x16 memories.

Featuring high-performance Word-Program, the SST39LF200A/400A/800A and SST39VF200A/400A/800A devices provide a typical Word-Program time of 14 μ sec. The devices use Toggle Bit or Data# Polling to detect the completion of the Program or Erase operation. To protect against inadvertent write, they have on-chip hardware and software data protection schemes. Designed, manufactured and tested for a wide spectrum of applications, these devices are offered with a guaranteed typical endurance of 100,000 cycles. Data retention is rated at greater than 100 years.

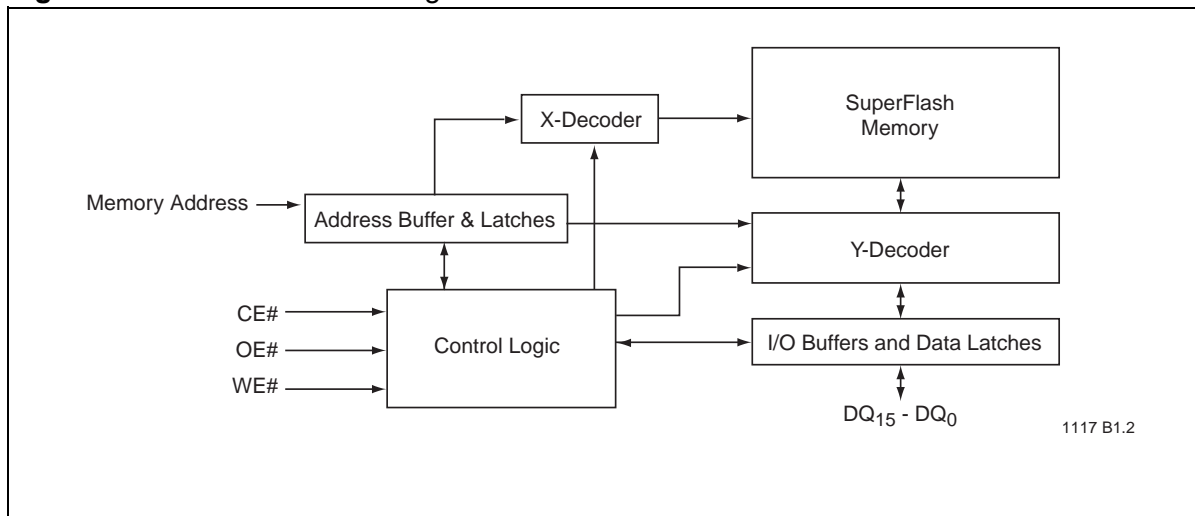

The SST39LF200A/400A/800A and SST39VF200A/400A/800A devices are suited for applications that require convenient and economical updating of program, configuration, or data memory. For all system applications, they significantly improve performance and reliability while lowering power consumption. They inherently use less energy during Erase and Program than alternative Flash technologies. When programming a Flash device, the total energy consumed is a function of the applied voltage, current and time of application. For any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time. Therefore, the total energy consumed during any Erase or Program operation is less than alternative Flash technologies. These devices also improve flexibility while lowering the cost for program, data and configuration storage applications.

The SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore, the system software or hardware does not have to be modified or de-rated as is necessary with alternative Flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles.

To meet surface mount requirements, the SST39LF200A/400A/800A and SST39VF200A/400A/800A are offered in 48-lead TSOP packages, 48-ball TFBGA packages, and 48-ball WFBGA packages. See Figures 2, 3 and 4 for pin assignments.

1117 48-tsop P01.3

Figure 3: Pin Assignments for 48-Ball TFBGA

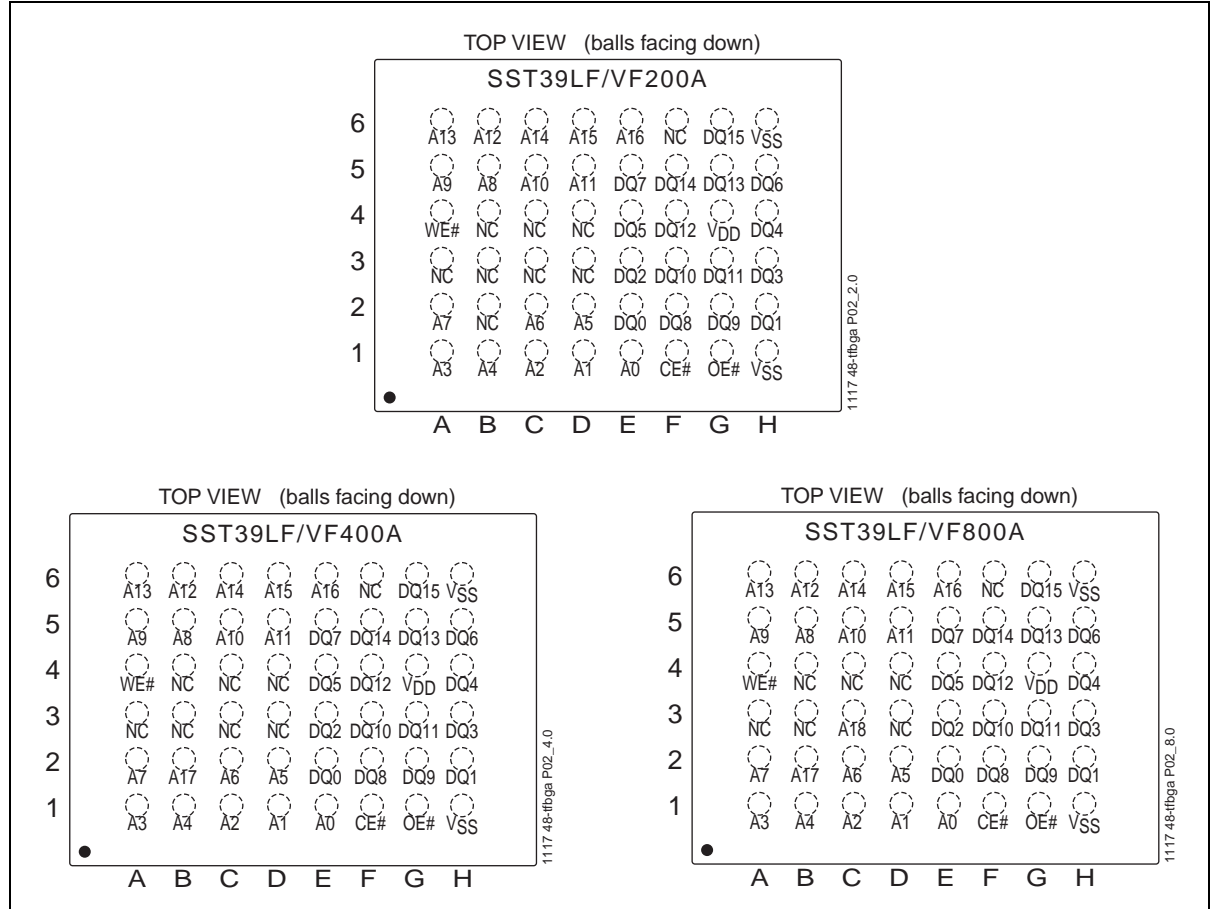

Figure 4: Pin Assignments for 48-Ball WFBGA

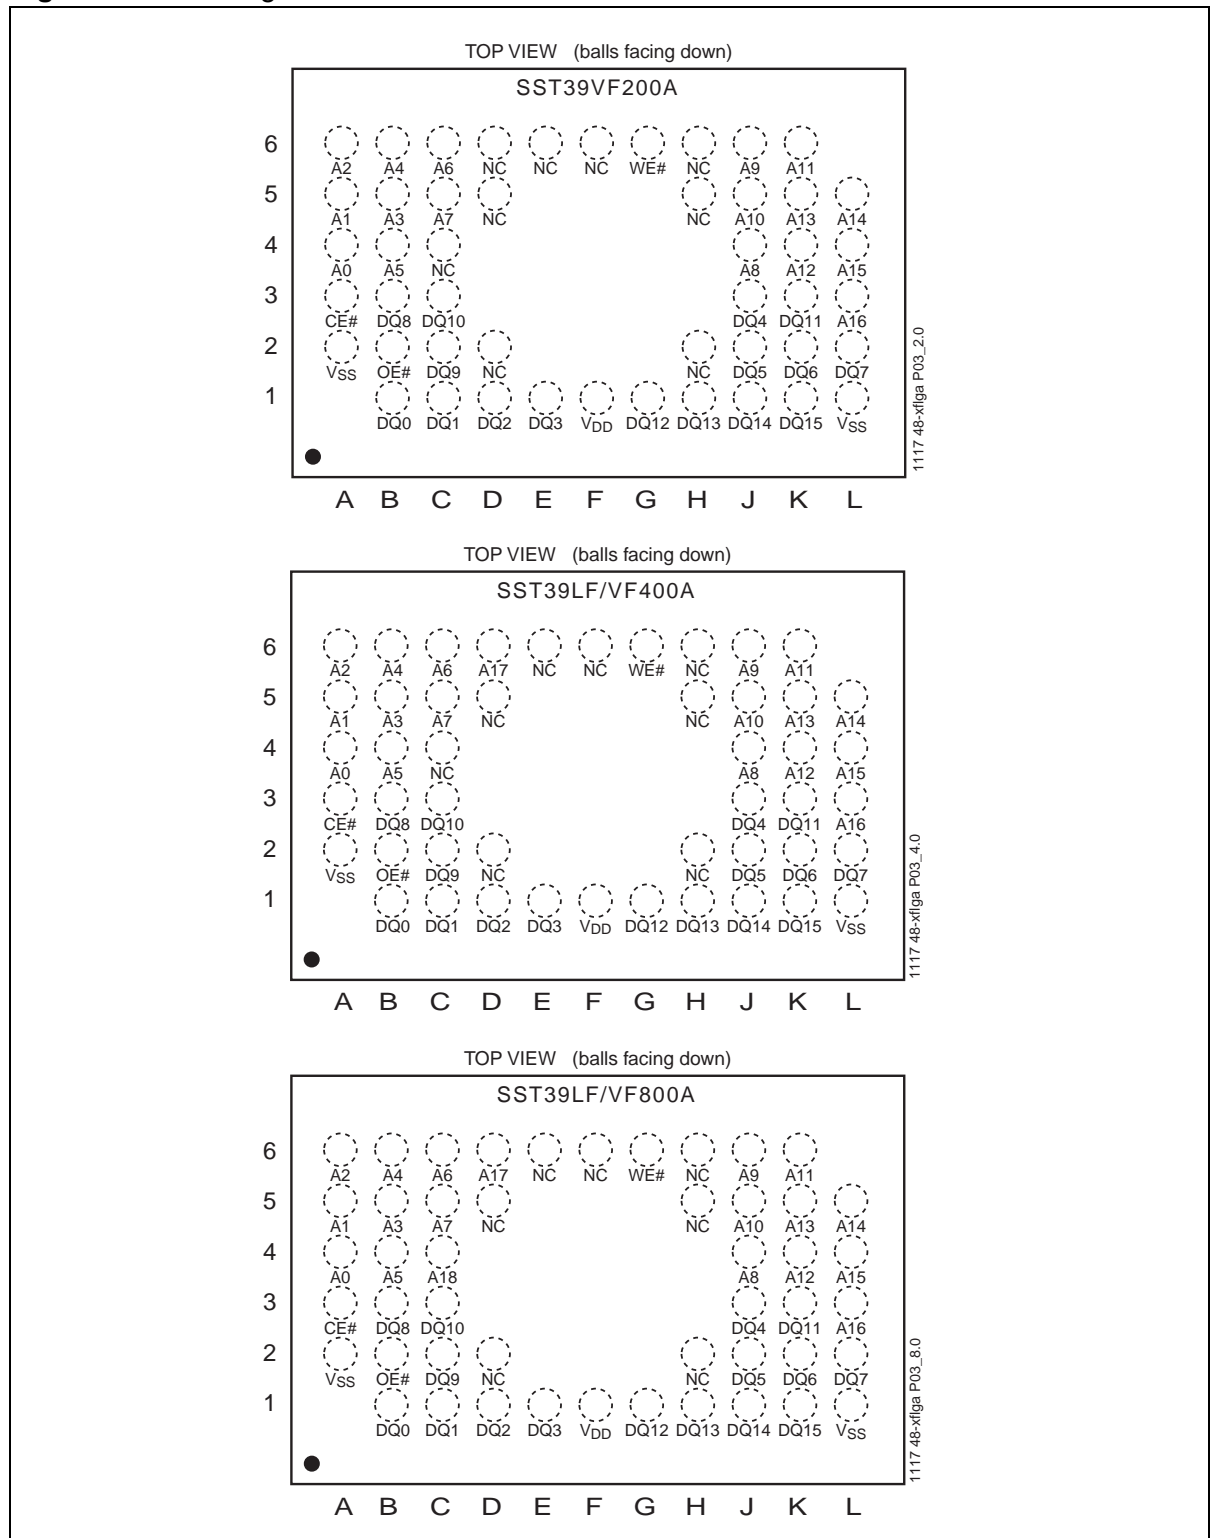

Table 1: Pin Description

Symbol	Pin Name	Functions
$A_{MS}^1-A_0$	Address Inputs	To provide memory addresses. During Sector-Erase $A_{MS}-A_{11}$ address lines will select the sector. During Block-Erase $A_{MS}-A_{15}$ address lines will select the block.
$DQ_{15}-DQ_0$	Data Input/output	To output data during Read cycles and receive input data during Write cycles. Data is internally latched during a Write cycle. The outputs are in tri-state when $OE\#$ or $CE\#$ is high.
$CE\#$	Chip Enable	To activate the device when $CE\#$ is low.
$OE\#$	Output Enable	To gate the data output buffers.
$WE\#$	Write Enable	To control the Write operations.
V_{DD}	Power Supply	To provide power supply voltage: 3.0V-3.6V for SST39LF200A/400A/800A 2.7V-3.6V for SST39VF200A/400A/800A
V_{SS}	Ground	
NC	No Connection	Unconnected pins.

T1.2.25001

1. A_{MS} = Most significant address

A_{MS} = A_{16} for SST39LF/VF200A, A_{17} for SST39LF/VF400A and A_{18} for SST39LF/VF800A

Device Operation

Commands are used to initiate the memory operation functions of the device. Commands are written to the device using standard microprocessor write sequences. A command is written by asserting WE# low while keeping CE# low. The address bus is latched on the falling edge of WE# or CE#, whichever occurs last. The data bus is latched on the rising edge of WE# or CE#, whichever occurs first.

Read

The Read operation of the SST39LF200A/400A/800A and SST39VF200A/400A/800A is controlled by CE# and OE#, both have to be low for the system to obtain data from the outputs. CE# is used for device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either CE# or OE# is high. Refer to the Read cycle timing diagram for further details (Figure 5).

Word-Program Operation

The SST39LF200A/400A/800A and SST39VF200A/400A/800A are programmed on a word-by-word basis. Before programming, the sector where the word exists must be fully erased. The Program operation is accomplished in three steps. The first step is the three-byte load sequence for Software Data Protection. The second step is to load word address and word data. During the Word-Program operation, the addresses are latched on the falling edge of either CE# or WE#, whichever occurs last. The data is latched on the rising edge of either CE# or WE#, whichever occurs first. The third step is the internal Program operation which is initiated after the rising edge of the fourth WE# or CE#, whichever occurs first. The Program operation, once initiated, will be completed within 20 μ s. See Figures 6 and 7 for WE# and CE# controlled Program operation timing diagrams and Figure 18 for a flowchart. During the Program operation, the only valid reads are Data# Polling and Toggle Bit. During the internal Program operation, the client is free to perform additional tasks. Any commands issued during the internal Program operation are ignored.

Sector/Block-Erase Operation

The Sector- (or Block-) Erase operation allows the system to erase the device on a sector-by-sector (or block-by-block) basis. The SST39LF200A/400A/800A and SST39VF200A/400A/800A offer both Sector-Erase and Block-Erase modes. The sector architecture is based on uniform sector size of 2 KWord. The Block-Erase mode is based on uniform block size of 32 KWord. The Sector-Erase operation is initiated by executing a six-byte command sequence with Sector-Erase command (30H) and sector address (SA) in the last bus cycle. The Block-Erase operation is initiated by executing a six-byte command sequence with Block-Erase command (50H) and block address (BA) in the last bus cycle. The sector or block address is latched on the falling edge of the sixth WE# pulse, while the command (30H or 50H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. The End-of-Erase operation can be determined using either Data# Polling or Toggle Bit methods. See Figures 11 and 12 for timing waveforms. Any commands issued during the Sector- or Block-Erase operation are ignored.

Chip-Erase Operation

The SST39LF200A/400A/800A and SST39VF200A/400A/800A provide a Chip-Erase operation, which allows the user to erase the entire memory array to the '1' state. This is useful when the entire device must be quickly erased.

The Chip-Erase operation is initiated by executing a six-byte command sequence with Chip-Erase command (10H) at address 5555H in the last byte sequence. The Erase operation begins with the rising edge of the sixth WE# or CE#, whichever occurs first. During the Erase operation, the only valid read is Toggle Bit or Data# Polling. See [Table 4](#) for the command sequence, [Figure 10](#) for the timing diagram and [Figure 21](#) for a flowchart. Any commands issued during the Chip-Erase operation are ignored.

Write Operation Status Detection

The SST39LF200A/400A/800A and SST39VF200A/400A/800A provide two software means to detect the completion of a write (Program or Erase) cycle to optimize the system write cycle time. The software detection includes two status bits: Data# Polling (DQ₇) and Toggle Bit (DQ₆). The End-of-Write detection mode is enabled after the rising edge of WE#, which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system; therefore, either a Data# Polling or Toggle Bit read may be simultaneous with the completion of the write cycle. If this occurs, the system may possibly get an erroneous result, i.e., valid data may appear to conflict with either DQ₇ or DQ₆. To prevent spurious rejection, if an erroneous result occurs, the software routine should include a loop to read the accessed location an additional two (2) times. If both reads are valid, then the device has completed the write cycle, otherwise the rejection is valid.

Data# Polling (DQ₇)

When the SST39LF200A/400A/800A and SST39VF200A/400A/800A devices are in the internal Program operation, any attempt to read DQ₇ will produce the complement of the true data. Once the Program operation is completed, DQ₇ will produce true data. Note that even though DQ₇ may have valid data immediately following the completion of an internal Write operation, the remaining data outputs may still be invalid: valid data on the entire data bus will appear in subsequent successive Read cycles after an interval of 1 μ s. During internal Erase operation, any attempt to read DQ₇ will produce a '0'. Once the internal Erase operation is completed, DQ₇ will produce a '1'. Data# Polling is valid after the rising edge of the fourth WE# (or CE#) pulse for Program operation. For Sector-, Block- or Chip-Erase, Data# Polling is valid after the rising edge of the sixth WE# (or CE#) pulse. See [Figure 8](#) for Data# Polling timing diagram and [Figure 19](#) for a flowchart.

Toggle Bit (DQ₆)

During the internal Program or Erase operation, any consecutive attempts to read DQ₆ will produce alternating 1s and 0s, i.e., toggling between '1' and '0'. When the internal Program or Erase operation is completed, the DQ₆ bit will stop toggling. The device is then ready for the next operation. The Toggle Bit is valid after the rising edge of the fourth WE# (or CE#) pulse for Program operation. For Sector-, Block- or Chip-Erase, the Toggle Bit is valid after the rising edge of the sixth WE# (or CE#) pulse. See [Figure 9](#) for the Toggle Bit timing diagram and [Figure 19](#) for a flowchart.

Data Protection

The SST39LF200A/400A/800A and SST39VF200A/400A/800A provide both hardware and software features to protect nonvolatile data from inadvertent writes.

Hardware Data Protection

Noise/Glitch Protection: A WE# or CE# pulse of less than 5 ns will not initiate a write cycle.

V_{DD} Power Up/Down Detection: The Write operation is inhibited when V_{DD} is less than 1.5V.

Write Inhibit Mode: Forcing OE# low, CE# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

Software Data Protection (SDP)

The SST39LF200A/400A/800A and SST39VF200A/400A/800A provide the JEDEC approved Software Data Protection scheme for all data alteration operations, i.e., Program and Erase. Any Program operation requires the inclusion of the three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations, e.g., during the system power-up or power-down. Any Erase operation requires the inclusion of six-byte sequence. These devices are shipped with the Software Data Protection permanently enabled. See [Table 4](#) for the specific software command codes. During SDP command sequence, invalid commands will abort the device to Read mode within TRC. The contents of DQ₁₅-DQ₈ can be V_{IL} or V_{IH}, but no other value, during any SDP command sequence.

Common Flash Memory Interface (CFI)

The SST39LF200A/400A/800A and SST39VF200A/400A/800A devices also contain the CFI information to describe the characteristics of the device. To enter the CFI Query mode, the system must write three-byte sequence, same as Software ID Entry command with 98H (CFI Query command) to address 5555H in the last byte sequence. Once the device enters CFI Query mode, the system can read CFI data at the addresses given in [Tables 5 through 9](#). The system must write the CFI Exit command to return to Read mode from the CFI Query mode.

Product Identification

Product Identification mode identifies the devices as the SST39LF/VF200A, SST39LF/VF400A and SST39LF/VF800A and the manufacturer as Microchip. This mode may be accessed by software operations. Users may use the Software Product Identification operation to identify the part (i.e., using the device ID) when using multiple manufacturers in the same socket. For details, see [Table 4](#) for software operation, [Figure 13](#) for the Software ID Entry and Read timing diagram and [Figure 20](#) for the Software ID Entry command sequence flowchart.

Table 2: Product Identification

	Address	Data
Manufacturer's ID	0000H	00BFH
Device ID		
SST39LF/VF200A	0001H	2789H
SST39LF/VF400A	0001H	2780H
SST39LF/VF800A	0001H	2781H

T2.3 25001

Product Identification Mode Exit/CFI Mode Exit

To return to the standard Read mode, the Software Product Identification mode must be exited. Exit is accomplished by issuing the Software ID Exit command sequence, which returns the device to the Read mode. This command may also be used to reset the device to the Read mode after any inadvertent transient condition that causes the device to behave abnormally, e.g., not read correctly. Please note that the Software ID Exit/CFI Exit command is ignored during an internal Program or Erase operation. See [Table 4](#) for software command codes, [Figure 15](#) for timing waveform and [Figure 20](#) for a flowchart.

Operations

SST39VF200A / SST39VF400A / SST39VF800A

Data Sheet

Absolute Maximum Stress Ratings (Applied conditions greater than those listed under “Absolute Maximum Stress Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions or conditions greater than those defined in the operational sections of this data sheet is not implied. Exposure to absolute maximum stress rating conditions may affect device reliability.)

Temperature Under Bias	-55°C to +125°C
Storage Temperature	-65°C to +150°C
D. C. Voltage on Any Pin to Ground Potential	-0.5V to $V_{DD}+0.5V$
Transient Voltage (<20 ns) on Any Pin to Ground Potential	-2.0V to $V_{DD}+2.0V$
Voltage on A_9 Pin to Ground Potential	-0.5V to 13.2V
Package Power Dissipation Capability ($T_A = 25^\circ C$)	1.0W
Surface Mount Solder Reflow Temperature ⁽¹⁾	260°C for 10 seconds
Output Short Circuit Current ⁽²⁾	50 mA

1. Excluding certain with-Pb 32-PLCC units, all packages are 260°C capable in both non-Pb and with-Pb solder versions. Certain with-Pb 32-PLCC package types are capable of 240°C for 10 seconds; please consult the factory for the latest information.
2. Outputs shorted for no more than one second. No more than one output shorted at a time.

Operating Range: SST39LF200A/400A/800A

Range	Ambient Temp	V_{DD}
Commercial	0°C to +70°C	3.0V-3.6V

T9.1 25001

Operating Range: SST39VF200A/400A/800A

Range	Ambient Temp	V_{DD}
Commercial	0°C to +70°C	2.7V-3.6V
Industrial	-40°C to +85°C	2.7V-3.6V

T9.1 25001

Table 10: AC Conditions of Test⁽¹⁾

Input Rise/Fall Time	Output Load SST39LF200A/400A/800A	Output Load SST39VF200A/400A/800A
5ns	$C_L = 30 \text{ pF}$	$C_L = 100 \text{ pF}$

T10.1 25001

1. See Figures 16 and 17.

Table 11: DC Operating Characteristics $-V_{DD} = 3.0\text{-}3.6\text{V}$ for SST39LF200A/400A/800A and $2.7\text{-}3.6\text{V}$ for SST39VF200A/400A/800A⁽¹⁾

Symbol	Parameter	Limits			Test Conditions
		Min	Max	Units	
I _{DD}	Power Supply Current				Address input= V_{ILT}/V_{IHT} , at $f=1/T_{RC}$ Min, $V_{DD}=V_{DD}$ Max
	Read ⁽²⁾	—	30	mA	CE#= V_{IL} , OE#= $WE\#=V_{IH}$, all I/Os open
	Program and Erase	—	30	mA	CE#= $WE\#=V_{IL}$, OE#= V_{IH}
I _{SB}	Standby V_{DD} Current	—	20	μA	CE#= V_{IHC} , $V_{DD}=V_{DD}$ Max
I _{LI}	Input Leakage Current	—	1	μA	$V_{IN}=\text{GND}$ to V_{DD} , $V_{DD}=V_{DD}$ Max
I _{LO}	Output Leakage Current	—	10	μA	$V_{OUT}=\text{GND}$ to V_{DD} , $V_{DD}=V_{DD}$ Max
V _{IL}	Input Low Voltage	—	0.8	V	$V_{DD}=V_{DD}$ Min
V _{IH}	Input High Voltage	$0.7V_{DD}$	—	V	$V_{DD}=V_{DD}$ Max
V _{IHC}	Input High Voltage (CMOS)	$V_{DD}-0.3$	—	V	$V_{DD}=V_{DD}$ Max
V _{OL}	Output Low Voltage	—	0.2	V	$I_{OL}=100\ \mu\text{A}$, $V_{DD}=V_{DD}$ Min
V _{OH}	Output High Voltage	$V_{DD}-0.2$	—	V	$I_{OH}=-100\ \mu\text{A}$, $V_{DD}=V_{DD}$ Min

T11.7 25001

1. Typical conditions for the Active Current shown on page 1 are average values at 25°C (room temperature), and $V_{DD} = 3\text{V}$ for VF devices. Not 100% tested.
2. Values are for 70 ns conditions. See the *Multi-Purpose Flash Power Rating* application note for further information.

Table 12: Recommended System Power-up Timings

Symbol	Parameter	Minimum	Units
T _{PU-READ} ⁽¹⁾	Power-up to Read Operation	100	μs
T _{PU-WRITE} ⁽¹⁾	Power-up to Program/Erase Operation	100	μs

T12.0 25001

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

Table 13: Capacitance ($T_A = 25^\circ\text{C}$, $f=1\text{ Mhz}$, other pins open)

Parameter	Description	Test Condition	Maximum
C _{I/O} ⁽¹⁾	I/O Pin Capacitance	$V_{I/O} = 0\text{V}$	12 pF
C _{IN} ⁽¹⁾	Input Capacitance	$V_{IN} = 0\text{V}$	6 pF

T13.0 25001

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

Table 14: Reliability Characteristics

Symbol	Parameter	Minimum Specification	Units	Test Method
N _{END} ^{(1),(2)}	Endurance	10,000	Cycles	JEDEC Standard A117
T _{DR} ⁽¹⁾	Data Retention	100	Years	JEDEC Standard A103
I _{LTH} ⁽¹⁾	Latch Up	$100 + I_{DD}$	mA	JEDEC Standard 78

T14.2 25001

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.
2. N_{END} endurance rating is qualified as a 10,000 cycle minimum for the whole device. A sector- or block-level rating would result in a higher minimum specification.

AC Characteristics

Table 15: Read Cycle Timing Parameters $V_{DD} = 3.0\text{-}3.6\text{V}$

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable" Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at <https://www.microchip.com/en-us/support/design-help/client-support-services>.
